

SHAVER SOCKET

WARNING Never take risks with electrical safety. Always disconnect the mains power before beginning any electrical work and test that it is isolated - it is NOT enough just to turn off the light switch. Electrical products must be installed in accordance with IET regulations (BS 7671). If you are in any doubt, always consult a qualified electrician or an experienced person registered with an electrical Competent Person Scheme. Further information is available online or from your Local Authority. If the lighting circuit is not protected by a Residual Current Device (RCD) then the installation should be carried out and tested by a qualified electrician. If necessary, use a suitable stepladder, but first read the useful advice given by the Health and Safety Executive. Visit www.hse.gov.uk and search for 'using stepladders'.

Your shaver socket

Your shaver socket is suitable for indoor use only; it features a double-wound isolating transformer with internal fuse and can support power outputs up to 20VA at either 115VAC or 230VAC (50Hz). Your shaver socket complies with BS EN 61558-2-5 and is suitable for use in bathroom Zone 2 (i.e. next to or above wash basins but not in the immediate vicinity of baths or showers - check online for details).

Your shaver socket fits into a standard UK double gang wall box, with a minimum depth of 47mm. The power input to your shaver socket should originate from the lighting circuit of the room.

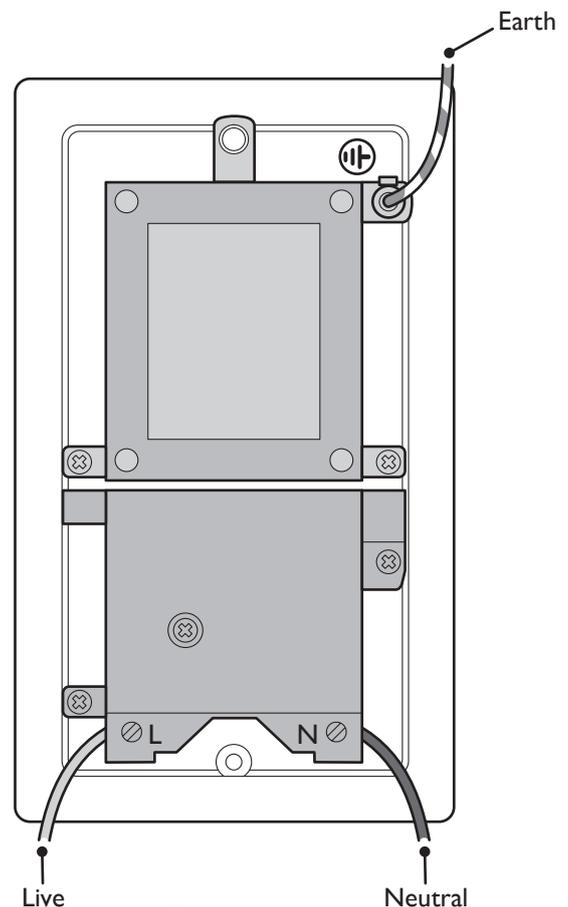

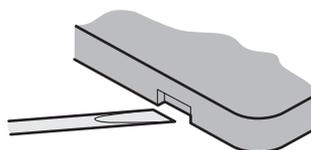

Note: This product must be installed in accordance with local building regulations.

IMPORTANT: If you are in any doubt, STOP and seek professional help. Do not proceed unless you are sure.

To fit your shaver socket

- 1 Ensure that the mains supply to the circuit is isolated.
- 2 If a shaver socket is already fitted, take a photographic record of the connections to its terminals. There should be live, neutral and earth connections, all originating from the lighting circuit. Remove the existing shaver socket.
- 3 Connect the wires to your new shaver socket as shown in the diagram right.
- 4 Ensure that the bare copper earth connection has a green/yellow sleeve to isolate it from other connections. Check that screw terminals are properly tightened and no bare wires are visible.
- 5 Secure the shaver socket in place within the wall box. Then, clip the front cover into place.
- 6 Your new shaver socket is ready for testing.

Remove the front cover from your switch. Insert a small flat blade screwdriver into one of the slots on the left side and carefully prise off the front cover.

Note: The power input to your shaver socket should originate from the lighting circuit of the room.

Connection	Old wire colours	New wire colours	Diagram shading
Live (L)	Red	Brown	
Neutral (N)	Black	Blue	
Earth (⊕)	Green	Green/Yellow
